SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	01/22/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Office Action Summary

Application No.

10/686,886

Applicant(s)

RYGAARD, CHRISTOPHER A.

Examiner

Randal D. Moran

Art Unit

2135

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 15 October 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 15 October 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

Continuation of Attachment(s) 3). Information Disclosure Statement(s) (PTO/SB/08), Paper No(s)/Mail Date :3/1/2004, 3/22/2004, and 2/14/2005.

DETAILED ACTION

1. The Information Disclosure Statements filed on 3/1/2002, 3/22/2004, and 2/14/2005 have been considered by the examiner.
2. Claims 1-23 are pending in the application.

Claim Objections

3. The following claims are objected to for lack of antecedent basis.
 - a.) **Claim 2- line 3, Claim 3- line 26, Claim 4- line 4, Claim 6- lines 2-3, Claim 7- line 2, Claim 8- line 3, Claim 13- line 3, Claim 15- line 3, Claim 16, line 2, Claim 17- lines 2 and 4, Claim 18- lines 2 and 4, Claim 21- line 3, Claim 22- lines 2, 3, and 4, and Claim 23- line 4** recite the limitation "the piece of code." "The piece of code from the database" would make the claim less ambiguous.

Drawings

4. Figures 1-2 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to

avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. **Claims 1-23** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Jansen et al. (NIST Special Publication 800-19 – Mobile Agent Security)**, hereafter "Jansen" in view of **Walsh (US 6,233,601)**.

7. Jansen is cited by the applicant in IDS paper filed on 2/14/2005.

7. Considering **Claim 1**, Jansen discloses a computer implemented jumping application security console (Section 3.2- Integrity, lines 1-5) that maintains the

security of a jumping application that is jumping between one or more hosts connected to the security console (Figure 1, Section 4.2 – Protecting Agents, ¶ 3 lines 4-6), the security console comprising: a security module that controls the security of a jumping application (Section 4.1 – Protecting the agent platform, lines 1-27).

Jansen does not disclose a database that contains one or more pieces of code and a description of each piece of code, wherein each piece of code implements a particular behavior; and wherein the security module further comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior.

Walsh does disclose a database that contains one or more pieces of code and a description of each piece of code (column 2, lines 23-25, column 4, lines 25-28 and 37-38), wherein each piece of code implements a particular behavior (column 4, lines 64-67, column 5, lines 1-5); and wherein the security module further comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by a database containing code that will replace code on the jumping application as

taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

8. Considering **Claim 5**, Jansen discloses a computer implemented jumping application security console (Section 3.2- Integrity, lines 1-5) that maintains the security of a jumping application that is jumping between one or more hosts connected to the security console (Figure 1, Section 4.2 – Protecting Agents, ¶ 3 lines 4-6), the security console comprising: means for controlling the security of a jumping application (Section 4.1 – Protecting the agent platform, lines 1-27). Jansen does not disclose means for storing one or more pieces of code and a description of each piece of code, wherein each piece of code implements a particular behavior; and wherein the security controlling means further comprises means for replacing code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior.

Walsh does disclose means for storing one or more pieces of code and a description of each piece of code (column 2, lines 23-25, column 4, lines 25-28 and 37-38), wherein each piece of code implements a particular behavior (column 4, lines 64-67, column 5, lines 1-5); and wherein the security controlling means further comprises means for replacing code from the jumping application

that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by a database containing code that will replace code on the jumping application as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

9. Considering **Claim 9**, Jansen discloses a computer-implemented method for controlling the security of a jumping application in a jumping application system (Figure 1, Section 4.2 – Protecting Agents, ¶ 3 lines 4-6, Section 3.2- Integrity, lines 1-5).

Jansen does not disclose receiving a request for a piece of code that implements a particular behavior for a jumping application; and replacing code in the jumping application that implements the particular behavior with a piece of code that implements the particular behavior into the jumping application so that the jumping application has the particular behavior when it is executed by a host in the jumping application system.

Walsh does disclose receiving a request for a piece of code that implements a particular behavior for a jumping application (column 4, lines 30-35); and replacing code in the jumping application that implements the particular behavior with a piece of code that implements the particular behavior into the jumping application so that the jumping application has the particular behavior when it is executed by a host in the jumping application system (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by a database containing code that will replace code on the jumping application as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

10. Considering **Claim 14**, Jansen discloses a jumping application security system (Section 3.2- Integrity, lines 1-5), comprising: a security console computer system that control the security of a jumping application in the jumping application security system (Section 4.1 – Protecting the agent platform); one or more host computers connected to the first computer by a computer network (Figure 1), wherein each host computer executes a jumping application (Figure 1).

Jansen does not disclose the console further comprises a database that contains one or more pieces of code and a description of each piece of code, wherein each piece of code implements a particular behavior; and a security module that comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior.

Walsh does disclose the console further comprises a database that contains one or more pieces of code and a description of each piece of code (column 2, lines 23-25, column 4, lines 25-28 and 37-38), wherein each piece of code implements a particular behavior (column 4, lines 64-67, column 5, lines 1-5); and a security module that comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by a database containing code that will replace code on the jumping application as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

Art Unit: 2196

11. Considering **Claim 20**, Jansen discloses a server computer for a jumping application security system (Section 4.2 – Protecting Agents, ¶ 3 lines 4-6). Jansen does not disclose the server comprising: a processor; a memory connected to the processor; a database connected to the processor that contains one or more pieces of code and a description of each piece of code, wherein each piece of code implements a particular behavior; and wherein the memory further comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior.

Walsh does disclose the server comprising: a processor; a memory connected to the processor (column 4, lines 25-28); a database connected to the processor that contains one or more pieces of code and a description of each piece of code (column 2, lines 23-25, column 4, lines 25-28 and 37-38), wherein each piece of code implements a particular behavior (column 4, lines 64-67, column 5, lines 1-5); and wherein the memory further comprises instructions that replace code from the jumping application that implements a first behavior with a piece of code from the database into the jumping application that implements the first behavior (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by a database containing code that will replace code on the jumping application as taught by Walsh for the benefit of having a home code base that will provide the

desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

12. Considering **Claims 2, 6, 10, 15, and 21**, Jansen does not disclose the instructions that replace code further comprises instructions that remove any existing code in the jumping application and then instructions that insert the piece of code that implements the particular behavior into the jumping application. Walsh does disclose the instructions that replace code further comprises instructions that remove any existing code in the jumping application and then instructions that insert the piece of code that implements the particular behavior into the jumping application (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by instructions that will replace code on the jumping application as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

13. Considering **Claims 3, 7, and 16**, Jansen does not disclose the security module further comprises instructions for receiving a request for a piece of code, by a host, that implements a particular behavior for a jumping application.

Walsh does disclose the security module further comprises instructions for receiving a request for a piece of code, by a host, that implements a particular behavior for a jumping application (column 4, lines 30-35).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by instructions for receiving a request for a piece of code that implements a particular behavior as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

14. Considering **Claims 4, 8, 13, 19, and 23**, Jansen discloses instructions that store a list of the code removed from the jumping application (Section 4.1.2 – Safe Code Interpretation, ¶ 2 lines 7-13).

Jansen does not disclose the instructions to replace the code further comprises instructions that remove the code from the jumping application and instructions that insert the piece of code into the jumping application based on the list of code removed from the jumping application.

Walsh does disclose the instructions to replace the code further comprises instructions that remove the code from the jumping application (column 4, lines 30-35), and instructions that insert the piece of code into the jumping application

based on the list of code removed from the jumping application (column 4, lines 37-38, column 8, lines 32-36).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by instructions for removing code from the jumping application and inserting code based on the list as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

15. Considering **Claim 11**, Jansen does not disclose receiving the request further comprises generating a query, by a host to a security console, of the pieces of code contained in a database of the security console and selecting, by the host, the piece of code to be replaced in the jumping application.

Walsh does disclose the request further comprises generating a query, by a host to a security console, of the pieces of code contained in a database of the security console and selecting, by the host, the piece of code to be replaced in the jumping application (column 6, lines 49-52).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by generating a query to gather the piece of code from the database as taught by Walsh for the benefit of having a home code base that will provide the desired code to the

jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

16. Considering **Claim 12**, Jansen does not disclose the replacing the code further comprises downloading the piece of code to the host in response to the selection of the piece of code by the host and inserting the piece of code, by the host, into the jumping application to implement the particular behavior.

Walsh does disclose the replacing the code further comprises downloading the piece of code to the host in response to the selection of the piece of code by the host and inserting the piece of code, by the host, into the jumping application to implement the particular behavior (column 6, lines 49-62).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by downloading the piece of code to the host computer in response to the selection of the piece of code by the host and instructions on the host computer that insert the piece of code into the jumping application to implement the particular behavior as taught by Walsh for the benefit of having a the code readily available and not on the mobile system. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

17. Considering **Claim 17**, Jansen does not disclose the instructions that receive a request further comprises instructions on the host computer that generate a

query of the pieces of code contained in a database of the security console and instructions on the host computer that select the piece of code to be replaced in the jumping application.

Walsh does disclose the instructions that receive a request further comprises instructions on the host computer that generate a query of the pieces of code contained in a database of the security console (column 6, lines 49-52); and instructions on the host computer that select the piece of code to be replaced in the jumping application (column 4, lines 30-35).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by generating a query to gather the piece of code from the database as taught by Walsh for the benefit of having a home code base that will provide the desired code to the jumping application. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

18. Considering **Claims 18 and 22**, Jansen does not disclose the instructions that replace the code further comprises instructions that download the piece of code to the host computer in response to the selection of the piece of code by the host and instructions on the host computer that insert the piece of code into the jumping application to implement the particular behavior.

Walsh does disclose the instructions that replace the code further comprises instructions that download the piece of code to the host computer in response to

the selection of the piece of code by the host and instructions on the host computer that insert the piece of code into the jumping application to implement the particular behavior (column 6, lines 49-52).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Jansen by downloading the piece of code to the host computer in response to the selection of the piece of code by the host and instructions on the host computer that insert the piece of code into the jumping application to implement the particular behavior as taught by Walsh for the benefit of having a the code readily available and not on the mobile system. Having the necessary code on the jumping system would reduce the network load and provide for a more efficient system.

Conclusion

19. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Randal D. Moran whose telephone number is 571-270-1255. The examiner can normally be reached on M-F: 7:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nabil El-Hady can be reached on 571-272-3963. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
